5 Summary

6 Exploratory data analysis (EDA) involves examining the relationships between both categorical
7 and quantitative features. The gg1d R package streamlines EDA by providing a turnkey
8 approach to visualising n-dimensional data which graphically reveals correlative or associative
9 relationships between 2 or more features ([Figure 1](#)). gg1d represents all dataset features as
10 distinct, vertically aligned bar or tile plots, with plot types auto-selected based on whether
11 variables are categorical or numeric. It reduces both the code and time required to detect
12 complex multi-feature relationships that would otherwise only be found through statistical
13 modelling or thorough manual review ([Figure 2](#), [Figure 3](#)).

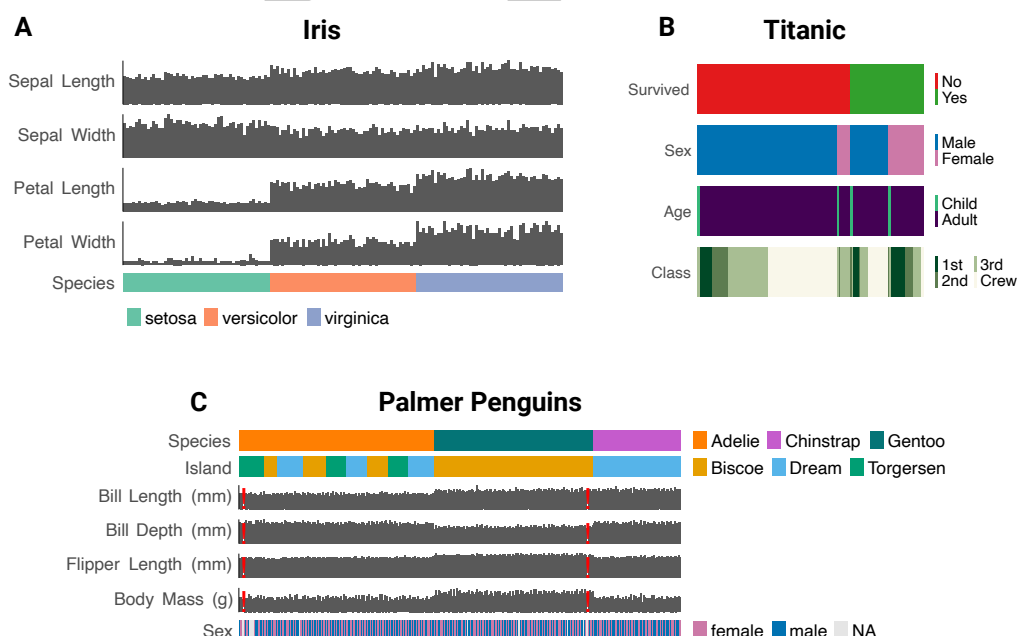

Figure 1: gg1d visualizations of common datasets revealing: A) Petals of the setosa species of iris are drastically smaller than other iris species; B) The majority of individuals who perished during the Titanic disaster were adult males; C) *Gentoo* penguins from Biscoe Island (dark green) have shallower bill depths than *Chinstrap* or *Adelie* penguins, despite their increased body mass. Exclamation marks indicate missing values.

14 Statement of Need

15 The R ecosystem already includes popular EDA packages such as `skimr`, which textually
16 summarizes completeness and descriptive statistics for individual features (1-dimensional), and
17 `GGally`, which graphically describes pairwise feature correlations (2-dimensional). `gg1d` is an
18 n-dimensional generalization with key advantages over other EDA packages, most notably its
19 ability to reveal more complex multidimensional patterns (Figure 2, Figure 3).

Feature	gg1d	Complex Heatmap	Data Explorer	skimr	GGally
Automatic Plot Generation	✓	✗	✓	✓	✓
Automatic plot selection by variable type	✓	✗	✓	✗	✓
Interactive Visualisations	✓	✗	✗	✗	✗
Supports cross-linking with other datasets	✓	✗	✗	✗	✗
Composable with Patchwork	✓	✓	✗	✗	✓
Describes features contribution to total variance (PCA)	✗	✗	✓	✗	✗
Generates Publication Quality Figures	✓	✓	✗	✗	✓
Reveals missingness dependent on multiple features	✓	✗	✗	✗	✗

Figure 2: Comparison of R packages that create visualisations commonly used for exploratory data analysis.

20 The benefits of `gg1d` are exemplified when visualizing the artificial Lazy Birdwatcher dataset,
21 which records magpie observations by two birdwatchers (Figure 3). One birdwatcher does
22 not work on weekends, creating a missing data pattern dependent on both birdwatcher and
23 day of the week. This multidimensional pattern becomes immediately apparent from `gg1d`
24 output, whereas it is difficult to detect using only one-dimensional EDA tools like `skimr` or
25 two-dimensional tools like `ggpairs` from the `GGally` package.

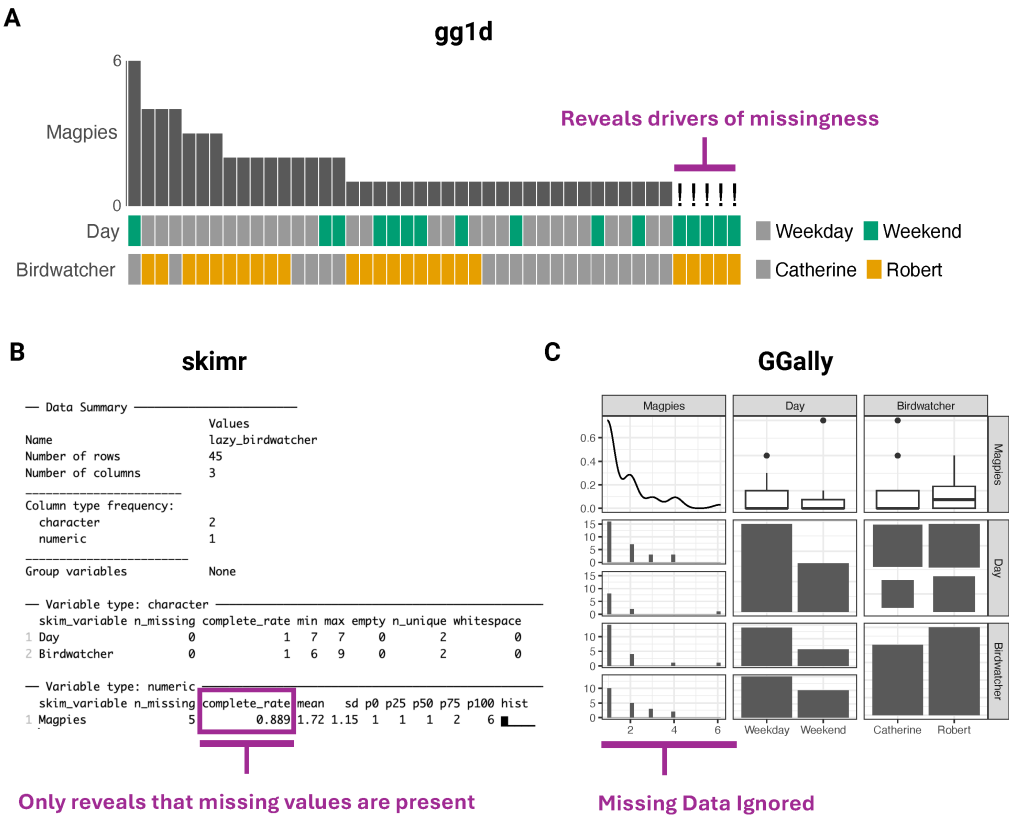

Figure 3: Visualisation of the Lazy Birdwatcher dataset using the **gg1d** package reveals a pattern of missingness dependent on multiple variables, Birdwatcher and Day (A). This pattern is difficult to detect using one-dimensional EDA tools like **skimr** (B) or two-dimensional tools like **ggpairs** from the **GGally** package (C).

We developed **gg1d** for the visualisation of clinical and multiomics data and anticipate it will provide prove valuable for any exploratory EDA activities. Further examples of **gg1d** visualisations are available in the [gg1d gallery](#).

Acknowledgements

We thank the developers of the packages integral to **gg1d**, especially David Gohel for **ggiraph** (Gohel & Skintzos, 2024), which enables its interactivity, and Thomas Lin Pedersen for **patchwork** (Pedersen, 2024) and **ggplot2** maintenance. We also acknowledge Hadley Wickham and all contributors to **ggplot2** (Wickham, 2016).
